

Row Garden Watering Kit

This is a good starter kit for watering a row garden, such as a vegetable garden. It can also be used with ornamental beds and raised beds. You can configure it however you want, but there are enough parts to water five 20' long rows. Covers 200 sq.ft. Water consumption is 100 gph.

Each Kit Contains:

100' of Drip Pipe with drippers installed every 12"	(XC257)
1/2" × 50' of Poly Header Hose	(XC251)
(5) 1/2" T-Connectors	(XC234)
(5) 1/2" Compression Ends	(XC231)
(1) 1/2" Elbow Connector	(XC228)
(1) 1/2" Hose/Faucet Connector	(XC237)

Installation is Easy

1. Lay out the main header hose in the area you want to water.
2. After determining the number and length of the rows you wish to water, cut the header hose into sections and attach the elbow and T-connectors at the top of each row.
3. Cut the drip pipe to the length of each row and insert the drip pipe sections into the connectors on the header hose. Press the compression ends onto the ends of your drip lines.
4. Attach the main header hose to your faucet or garden hose using the hose/faucet connector.

Note: *Do not use this system without the filter washer in place in the faucet connector; otherwise, the system will plug up and stop working.*

Adding more drip pipe and fittings easily extends this kit.
