

# Solar Construction

## STEP 1

### Site Preparation & Pre-Seeding

Project area will be prepared and vegetated to support future construction activities.

## STEP 2

### Pile Driving

Piles will be driven into the ground to support racking and modules.

## STEP 3

### Racking System

A single axis tracker will be installed to allow the modules to follow the sun.

## STEP 4

### Trenching

Trenches will be excavated for underground DC collection system below the surface.

## STEP 5

### Install Modules

Bifacial modules will be mounted on the racking system.

## STEP 6

### Inverters

Inverters will be installed within the project's internal infrastructure.

## STEP 7

### Post-Construction Restoration

Project area will be decompacted and reseeded following construction.

## STEP 8

### Operation

The solar farm is ready to interconnect to the grid and begin operation.

*Construction steps are tailored to the needs of each project and may vary.*
