Dave Shackleford
Senior Instructor
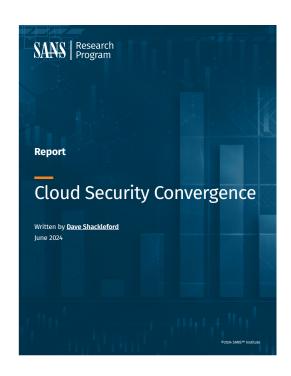

REPORT OVERVIEW:

Cloud Security Convergence:
How Controls Models for A Robust Cloud Security Stack Are Changing

As cloud security controls mature, it's common to find that a wide variety of security controls and configuration capabilities are melding into a single platform or service fabric, in addition to the cloud provider infrastructure. Ranging from CNAPP to CSPM to CWPP and beyond, controls that cover the pipeline, workload security, cloud environment configuration, IaC templates, and runtime (and much more) are starting to evolve into a much more consolidated set of solutions.

What does cloud security look like in 2024 and beyond? Chances are, you are talking to a set of providers that offer a lot of these features, and that's a great thing for security and cloud engineering teams.

Report highlights:
- Learn how Zero Trust architecture will continue to evolve in 2024 and beyond
- Discover how to streamline operations by integrating network and cloud native elements into a SASE architecture model
