# TECHNOLOGY ALONE

WON'T PROTECT YOU

When it comes to protecting yourself and your devices, antivirus software helps stop most malware attacks, but it cannot detect and stop all of them. In addition, it doesn't matter what device or operating system you are using; any one of them can become infected.

This is why it's so important for you to help defend against today's cyber attackers. Here are some common clues of an attack.

An urgent email or message that rushes you into making a mistake or pressures you to bypass our policies.

A message that sounds too good to be true. No, you did not win the lottery, especially one you never entered!

An odd or urgent message from a coworker, but the wording does not sound like them or the signature is wrong.

It is important to keep your antivirus and operating systems current with the latest security updates, but remember that technology alone cannot keep you secure. You are our best defense against cyber attackers. If you suspect an attack or malware infection, report it right away.
