### Vitals

- **Vital Signs**
  - Routine, PRN, Starting S For Until specified, Vital Signs Monitoring: Obtain vital signs (patient temperature, blood pressure and pulse) upon arrival, after start of medication, upon discontinuing infusion and before the patient departs the facility. However, if patient has an acute reaction with preceding dose, monitor vitals every 10 minutes for 30 minutes then every 30 minutes and for 30 minutes after infusion.

Emergency Medications

☑ ONC NURSING COMMUNICATION 35
Treatment of inFLIXmab or biosimilar infusion reactions
For mild reactions, the rate of infusion should be decreased to 10 mL/hour. Initiate a normal saline infusion (500 to 1,000 mL/hour) and appropriate symptomatic treatment (eg, acetaminophen and diphenhydramine); monitor vital signs every 10 minutes until normal. After 20 minutes, the infusion may be increased at 15-minute intervals, as tolerated, to completion (initial increase to 20 mL/hour, then 40 mL/hour, then 80 mL/hour, etc [maximum of 125 mL/hour]).

For moderate reactions, the infusion should be stopped or slowed. Initiate a normal saline infusion (500 to 1,000 mL/hour) and appropriate symptomatic treatment. Monitor vital signs every 5 minutes until normal. After 20 minutes, the infusion may be reinstituted at 10 mL/hour; then increased at 15-minute intervals, as tolerated, to completion (initial increase 20 mL/hour, then 40 mL/hour, then 80 mL/hour, etc [maximum of 125 mL/hour]).

For severe reactions, the infusion should be stopped and CONTACT PROVIDER for appropriate symptomatic treatment orders (eg, hydrocortisone/methylprednisolone, diphenhydramine and epinephrine) and monitor frequent vitals. Call 911 if necessary.
