

Tigers are usually solitary and need a lot of space to call their own. These "home ranges" are where tigers hunt and raise their young. A single tiger requires about 25,000 acres of home range! Imagine the number of acres needed by the 200–250 tigers in the Sundarbans—that's millions of acres of forest that need to be healthy and protected!

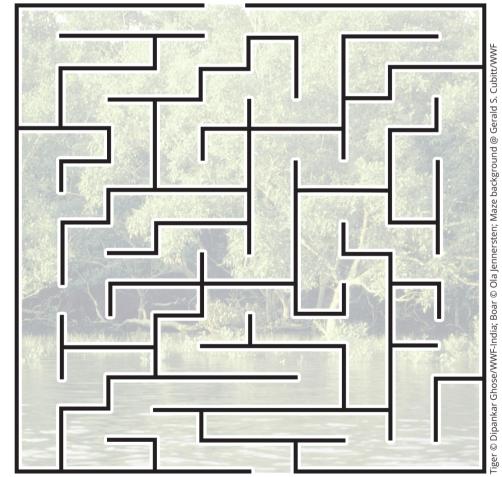

What's for dinner?

Tigers are carnivores, which means they eat meat. They can consume 88 pounds of meat at once! Their prey varies from small to large animals, but they mostly eat large-bodied mammals like deer, forest cattle, and wild boar.
