

PLANETS IN OUR SOLAR SYSTEM

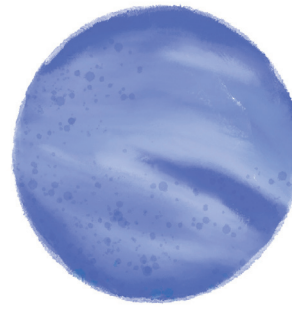

SATURN

This planet is surrounded by beautiful rings. It takes 29 earth years for Saturn to orbit the sun.

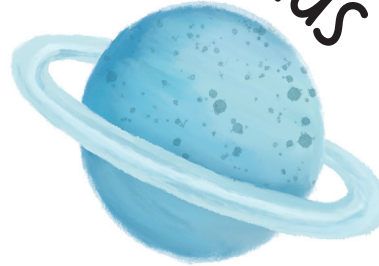

NEPTUNE

This is the furthest planet from the sun. It is the only planet in the solar system not visible to the naked eye.

URANUS

This planet has a unique tilt which makes Uranus appear to spin sideways. It also has the lowest temperature of all the planets.

MARS

This planet has two moons and is often known as the red planet because of all the iron in the soil.

JUPITER

The biggest planet in the solar system. The iconic great red spot is a giant storm that has been going on for hundreds of years.

VENUS

The second next planet from the sun, a day on this planet is longer than a whole year on earth!

EARTH

Our home planet and the only known planet to contain life!

MERCURY

This is the closest planet to the sun and the smallest in our solar system.
