

## Recommendation

Strength of  
recommendation

Certainty of  
evidence

In people with NSTEMACS at high or very high risk of adverse cardiovascular events, perform routine invasive coronary angiography, with coronary revascularisation (PCI or CABG) where appropriate.

Strong

High

In people with NSTEMACS at low or intermediate risk of adverse cardiovascular events, testing for inducible ischaemia (e.g. stress testing) may guide the need for invasive coronary angiography.

Weak

Moderate
