

★ Recommendation

Strength of recommendation

Certainty of evidence

For people with suspected ACS initially evaluated in the primary care setting, prompt transfer to a facility where definitive risk assessment can occur (e.g. ED) is recommended.

Consensus

Metropolitan health services should establish centralised support systems for regional and remote health services to facilitate:

- prompt assistance with ECG interpretation and access to troponin results when on-site access is not available
- provision of clinical advice to healthcare professionals
- access to cardiac investigations if required.
