ATTENTION: These products are indicated for adult patients and may not be right for you. Patients should discuss all risks and benefits with their eye doctor before surgery.

SEE LIFE BRILLIANTLY.

Presbyopia occurs as the natural lens in your eye gradually loses flexibility over time. This can make it difficult to see things up close. **Because a full life demands a full range of sight, your doctor can address presbyopia, with or without astigmatism, while replacing cataracts with a continuous range of high-quality vision.**

If you have both presbyopia and cataracts, with or without astigmatism, you may have the opportunity to address them simultaneously with an **extended depth of focus IOL.**

DISCOVER CONTINUOUS VISION.

Cataract surgery is trading one thing for another. When your cataract is removed, it is replaced by a small, soft lens called an *intraocular lens* — or *IOL* for short. You won't be able to feel or see the IOL, but it will stay inside your eye to help you see clearly.

Cataract surgery can also be an opportunity to reclaim your vision before presbyopia with an *Extended Depth of Focus IOL*.
