1

Gain the visibility you need

To do third-party risk management well, you need to see the data flows in one single source of truth.

2

Eliminate privacy's siloed existence

Leverage today's tech to collaborate cross-functionally on vendor reviews. What needs a closer look? What work has already been done?

3

Leverage automation to triage based on risk

Using today's tech tools and your improved visibility/cross-functional collaboration to triage based on risk.

TerraTrue

A bit more detail on visibility, risk scoring, and continuous monitoring

Know what's coming

You can't protect the data flows you can't see. This requires cross-functional inputs, so you have to break privacy's siloed existence to get the answers you need. Use a tool to build you a single source of truth on every vendor you use.

Use that visibility to identify risk

Your single source of truth will identify and map your data-sharing partners. Based on your risk-tolerance, you can group those vendors into "high," "medium," or "low" risk and triage reviews based on that grouping.

Automate your process for continuous monitoring

Once you've catalogued your vendors, leverage technology to keep your single source of truth current with automatic third-party vendor risk re-assessments, triggered automatically based on your criteria.
